DEPLOYMENT GUIDE

# Publish your career site on GitHub Pages

A step-by-step walkthrough for taking the Prahalad Rajbhar Career Site — the Europass CV & Cover Letter web app — from a folder on your computer to a live, shareable link. No coding required.

## 01 · UNZIP

Extract the site folder to your desktop.

## 02 · UPLOAD

Push it to a new GitHub repository.

## 03 · ENABLE

Turn on Pages in Settings.

## 04 · SHARE

Send your live link to employers.

## BEFORE YOU START

## What you'll need

This takes about ten minutes and needs nothing installed on your computer — everything happens in the browser, through GitHub's website.

- ☐ **The site files** — Prahālad\_Rajbhar\_Career\_Site.zip, unzipped somewhere you can find it (Desktop or Downloads).
- ☐ **A GitHub account** — free, sign up at [github.com](https://github.com) if you don't have one.
- ☐ **Ten minutes** — most of it is waiting for GitHub to build the page.

**Important** — inside the zip is a folder called `site`. You upload what's *inside* that folder (`index.html`, `styles.css`, `script.js`, `assets/`) — not the `site` folder itself. If GitHub sees an extra folder layer, the page won't load correctly.

## WHAT'S INSIDE THE ZIP

```
site/
├─ index.html      the whole page – CV + Cover Letter
├─ styles.css      all the styling
├─ script.js       tab-switching logic
├─ README.md       repo homepage text
└─ assets/
    ├─ avatar.png
    ├─ Prahālad_Rajbhar_Europass_CV.pdf
    └─ Prahālad_Rajbhar_Cover_Letter.pdf
```

## STEP 1 - 3

# Create the repository

1

## Sign in and start a new repository

Go to **github.com** and sign in. Click the + icon in the top-right corner, then choose **New repository**.

2

## Name it and set it to Public

- Repository name — something like prahaḷad-rajbhar-cv
- Visibility — must be set to **Public** (free GitHub Pages requires this)
- Leave "Add a README" **unchecked** — you already have one in the zip

**Why public?** Free GitHub accounts can only publish Pages sites from public repositories. Everything in it — your CV text, contact details — becomes visible to anyone with the link, same as sending it directly to an employer.

3

## Click "Create repository"

You'll land on an empty repository page with an "uploading an existing file" link — that's what you'll use next.

## STEP 4

## Upload the files

4a

### Upload the top-level files

Click **uploading an existing file**. Drag in these four, straight from inside the site folder:

index.html

styles.css

script.js

README.md

4b

### Upload the assets folder

Drag the entire assets folder into the same upload box. GitHub keeps the folder structure automatically, so `avatar.png` and both PDFs will land inside `assets/` on the repo.

4c

### Commit the changes

Scroll down to "Commit changes." Add a short message like *"Initial site upload"* and click the green **Commit changes** button.

**Double-check** — after committing, the repo's file list should show `index.html`, `styles.css`, `script.js`, `README.md` and `assets/` sitting at the top level. If you see a `site/` folder wrapping everything, delete it and re-upload the contents directly.

## STEP 5 - 6

## Switch on GitHub Pages

5

### Open Pages settings

In your repository, click the **Settings** tab (top menu bar), then find **Pages** in the left sidebar, under "Code and automation."

6

### Set the source and save

| Setting | Value                |
|---------|----------------------|
| Source  | Deploy from a branch |
| Branch  | main                 |
| Folder  | / (root)             |

Click **Save**. GitHub takes one to two minutes to build the site.

7

### Find your live link

Refresh the Pages settings screen — a green banner appears with your URL:

```
https://<your-username>.github.io/prahāḷad-rajbhar-cv/
```

Open it. You should land on the CV view, with the toggle switching cleanly to the Cover Letter.

## KEEPING IT CURRENT

## Updating the site later

Whenever the CV, cover letter, or photo changes — open the file in the repo, click the pencil (edit) icon or use **Add file** → **Upload files** to replace it, and commit. The live site updates within a minute or two, same URL.

## TROUBLESHOOTING

**Q. The page is blank or shows a 404**

Check that `index.html` sits at the repository root — not inside a nested `site/` folder.

**Q. The photo or PDF downloads are broken**

Confirm the `assets` folder uploaded with all three files inside — `avatar.png` and both PDFs.

**Q. The fonts look like the browser default**

Give it a moment — the display font loads from Google Fonts over the internet and can lag slightly on first visit.

**Q. Can I use a custom domain, like `prahaladrajbhar.com`?**

Yes — GitHub Pages supports it for free. Add the domain under Settings → Pages → Custom domain, point your domain's DNS at GitHub, then enable "Enforce HTTPS."
